

Moonlight

Essence of Zeolite

Concept

We humans, produce the equivalent of our own weight in ATP daily. ATP (Adenosine Triphosphate) is an organic compound that provides energy for the many processes that are carried on in living cells.

However, we do not eat our body's weight in food daily. So where do we gain the extra mass required for the body functions? Our cells contain crystalline structures that allow different ultra low frequency wavelenghts to be absorbed by our bodies which combined with enzyme reactions, produce this important compound.

When examining natural ecosystems, organisms and living entities can be seen acting as antennae. An important part of these "antennae" are the crystalline structures that need to be optimized in order to smoothen the flow of energy and fulfill the organism's requirements through the opening of metabolic pathways.

When body pH is not correct and toxins are present, proper function of these antennae are hindered.

Attributes:

- Negatively charged mineral;
- Binds to toxins and free radicals;
- Helps elimination of heavy metals;
- Aids healthy digestion;
- Balances body pH;

About Us

Our goal is to promote and generate a paradigm shift in relation to industrial food production, from predominantly unsustainable methods towards those that are harmonic with nature, supplying huge efficiencies and productivity while protecting our most valuable assets; **Our health, our home and our planet.**

BREAKTHRU sees our society's wellbeing depends upon appropriate, sustainable agricultural practices. We work in favor of equality in access to health.

Health

Mineral components in the body work within certain ratios and are balanced based on the health of the organism. This balance relies on body pH differentials to expel toxins while maintaining essential elements.

Moonlight aids the body to make the absorption and removal of toxins that block some of the over 4,000 metabolic enzymes that our body requires to maintain proper health.

HOW DO I USE MOONLIGHT?

Take 1 drop per day and increase to 10 drops over the next 10-14 days. Maintain for a minimum of 6 months and reduce to 3-4 drops per day.

How we do it

The proprietary technologies that BREAKTHRU has developed and applied are the result of an understanding of natural processes. The goal is to increase the agricultural productive chain; from soils, seeds, plants and the final consumption of products.

It is possible to apply each technology separately to achieve isolated improvements in productive factors or they can be implemented in a combined manner to obtain stratospheric yields, making possible the production of nutritionally stabilized, market-ready products which can be stored for long periods after being harvested.
